○ Doping.

○ Imaging Diagnostics in Sports Medicine.

Introduction

The purpose of this study was to compare the effects of low intensity resistance training (LRT) and high intensity resistance training (HRT) on body composition and muscle strength in twenty-eight active postmenopausal older women.

Methods

Participants aged 59-75 years (mean age 66,9 ± 4,69 yr., mean height 152,7 ± 5,85 cm, mean weight 63,2 ± 7,44, postmenopausal years 19,1 ± 7,2), were matched on initial total bone mineral density and assigned on the ABBA procedure. The LRT group (n=9) performed the training at an intensity of 60% of one repetition maximum (1RM), and the HRT group (n=7) at 80% of 1RM. Both groups performed 2 sets per exercise, 8 exercises per session, twice a week, during 7 months. The control group (n=12) maintained calisthenics exercise for 2 sessions a week. Pre and post tests of 1RM were conducted at progressive resistance equipment, muscle strength was measured in a Cybex II isokinetic dynamometer, namely, peak torque of the non-dominant knee and elbow extensors and flexors at 60°.s⁻¹. Measurements of lean body mass (LBM) and fat mass (FM) were made by dual-energy X-ray absorptiometry (DXA, model QDR-1500, Hologic Inc., Waltman, MA).

Results

The results are expressed (table 1) by the determinations of the regression coefficients for the initial value of each variable, the partial regression coefficient, determination coefficient for the initial value and incremental determination coefficient for the years after-menopause and group, using as dependents variables the final values of the weight, lean body mass (LBM), percentage of the fat mass (MG%), isocinetic force and isotonic force.

Table 1

	Initial value		Years		Grup	
	β	R ² (%)	β	iR ² (%)	β	iR ² (%)
Weight (g)	0,961*	92,3*	-0,014	1,7*	0,043	0,2
LBM (g)						
Total	0,949*	90,1*	-0,041	0,2	0,005	0,0
Braços	0,870*	75,5*	-0,044	0,2	-0,159	2,5
Pernas	0,916*	83,9*	-0,049	0,2	-0,023	0,1
MG (%)						
Braços	0,923*	81,1*	-0,013	0,0	0,115	1,3
Pernas	0,948*	89,9*	0,043	0,2	0,014	0,0
Isocinetic Force						
Peak torque (Nm)						
Ext. Joelho	0,816*	66,6*	0,027	0,1	0,231	4,5
Flex. Cotovelo	0,670*	44,9*	0,324*	9,6*	0,043	0,1
Isotonic Force						
1RM (Kg)						
Ext. Pernas	-0,061	0,4	-0,062	0,4	0,143	1,9
Flex. Cotovelo	0,062	0,4	-0,077	0,6	0,227	4,9

Conclusions

Although there were no significantly statistics results, the data indicate substantial increases in strength of knee extension and elbow flexion in the HRT group, and on the arms LBM in the LRT group. These results

	<p>call for further research to determine the optimal training prescription for obtaining strength gains in older women.</p> <p>Key Words: postmenopausal women, strength training, muscle strength, lean body mass, fat mass</p>
